>>.(cancelea	,
100.(current	ly amended) A <u>flexible</u> laminate comprising a monofilm-formed or
multifilm-for	med <u>flexible</u> ply A, and another monofilm-formed or multifilm-formed <u>flexible</u> ply B,
both mainly	comprising orientable thermoplastic polymer materials, in which the ply A has a fluted
configuration	and $\underline{\text{the ply}}B$ on a first side is adhesively bonded in bonding zones to the crests on a
first side of t	ne ply A,
where:	
(a)	$\underline{\text{the ply}}$ B also has a fluted configuration, $\underline{\text{the }}\underline{\text{a}}$ flute direction of $\underline{\text{the ply}}$ B $\underline{\text{forming}}$
	\underline{forms} an angle from $\underline{generally}$ about $30\underline{\ ^\circ}$ up to and including $90\underline{\ ^\circ}$ to the \underline{a} flute
	direction of $\underline{\text{the ply}}A$ and the $\underline{\text{said}}$ bonding zones being on the crests of the first side
	of $\underline{\text{the ply}}\ B$ to produce spot $\underline{\text{bonding}}\ \underline{\text{bonds}}$ with the crests on the first side of $\underline{\text{the ply}}$
	A,
(b)	the adhesive bonding is
	(i) directly $\underline{\text{the ply}}\ A$ to $\underline{\text{the ply}}\ B$ and established through a lamination layer on
	the ply A and/or the ply B;
	(ii) established through a separate thin bonding film; or
	(iii) through a fibrous web adapted for bonding, and
(c)	the wavelengths of the flutes in the ply A and/or the ply B are no longer than 5 mm,
(0)	
	and the wavelengths of the flutes in both the ply A and the ply B are less than 10 mm.

83.(canceled) 84.(canceled) 85.(canceled)

- 1 101.(currently amended) The laminate according to claim 100, wherein either the a thickness
- 2 of each of the said plies is generally substantially the same in the bonding zones bonded and
- 3 unbonded non-bonding zones, or at least one of the plies exhibits first solid-state-attenuated zones
- 4 extending parallel to the flute direction, each bonding zone mainly being substantially located within
- 5 such a the first attenuated zones whereby each first attenuated zone is understood as delimited by the
- 6 positions where the thickness is an average between the a minimum thickness of this ply within the
- 7 first attenuated zones and the a ply's maximum thickness within the adjacent non-bonded non-
- 8 bonding zones.
- 1 102.(currently amended) The laminate according to claim 100, wherein the flute wavelength
- 2 in each of the two plies is no more than 4 mm. preferably no more than 3 mm and still more
- 3 preferably no more than 2 mm.
- 1 103.(currently amended) The laminate according to claim 100, wherein each of the two plies
- 2 the a curved length of a flute is on average at least 5% and preferably at least 10% longer than the
- 3 linear wavelength, the curved length being understood as the length of a curve through the a cross
- 4 section of a full flute wave including the bonding zone which curve lies in the middle between the
- 5 two surfaces of the ply.
- 1 104.(currently amended) The laminate according to claim 103, wherein at least one of said the
- 2 plies the said the average thickness of at least one of the plies is at least 15% of the ply's maximum
- 3 thickness.
- 1 105.(currently amended) The laminate according to claim 103, wherein the a width of each
- 2 bonding zone in at least one of the two plies is no less than 15%, preferably no less than 20%, and
- 3 still more preferably no less than 30% of the flute wavelength.
- $1 \quad 106. (\textbf{currently amended}) \quad \text{ The laminate according to claim } 100, \text{ wherein the flutes in at least one}$
- 2 of the two plies are evenly formed and extend in a generally <u>substantially</u> rectilinear shape.

- 1 107.(currently amended) The laminate according to claim 100, wherein the flutes in at least one
- 2 of the two plies, while extending mainly substantially along one direction, are curved, or zig-zagging
- 3 zig-zagged and/or branched.
- 1 108.(currently amended) The laminate according to claim 100, wherein the flutes in at least one
- 2 of the two plies, while extending mainly substantially along one direction, are differently shaped in
- 3 a pattern which gives a visual effect showing a name, text, logo or similar visual effect.
- 1 109.(mainly substantially) The laminate according to claim 100, wherein at least one of the two
- 2 plies has a metallic or iridescent gloss, or the two plies have different colors colors.
- 1 110.(currently amended) The laminate according to claim 100, wherein the main flute direction
- 2 in which the flutes of the ply A extend is generally substantially perpendicular to the main flute
- 3 direction in which the flutes of the ply B extend.
- 1 111.(currently amended) The laminate according to claim 110, wherein one of the said two flute
- 2 directions essentially coincide with the a machine direction of the lamination.
- 1 112.(currently amended) The laminate according to claim $\frac{100}{101}$, wherein $\frac{\text{the ply}}{\text{ply}}$ A, outside
- 2 its first attenuated zones, if such zones are present, is molecularly oriented mainly in a direction
- 3 parallel to the direction of its flutes flute direction or in a direction close substantially parallel to the
- 4 latter its flute direction as determined by shrinkage tests.
- 1 113.(currently amended) The laminate according to claim 112, wherein the ply B also is
- 2 molecularly oriented and <u>a ply</u> B's orientation outside its first attenuated zones, if such zones are
- 3 present, is higher than a ply A's average orientation in the same direction outside its first attenuated
- 4 zones, if such zones are present, the said two orientations being observable by shrinkage tests.
- 1 114.(currently amended) The laminate according to claim 112, wherein the <u>a</u> yield tension in
- 2 the ply A in a direction parallel to with its flutes flute direction and/or the a yield tension in the ply
- 3 B in a direction parallel to with its flutes flute direction, both referring to the cross-section of the

- 4 respective ply and determined in non-bonded narrow strips at an extension velocity of 500%min⁻¹.
- 5 is no less than 30 MPa, preferably no less than 50 MPa and still more preferably no less than 75
- 6 MPa.
- 1 115.(currently amended) The laminate according to claim 100, wherein the ply B has a lower
- 2 coefficient of elasticity than the ply A, both as measured in the direction perpendicular to the flute
- 3 direction of the ply A.
- 1 116.(currently amended) The laminate according to claim 112, wherein the choice of material
- 2 for the ply B and of depth of the ply A's fluting is such that by stretching of the laminate
- 3 perpendicular to the direction of the ply A's fluting up to the point where the ply A's waving has
- 4 disappeared, the ply B still has not undergone any significant plastic deformation, preferably the ply
- 5 B comprises a thermoplastic elastomer.
- 1 117.(currently amended) The laminate according to claim 112, wherein the ply B, outside its
- 2 first attenuated zones if such zones are present, has a main direction of molecular orientation parallel
- 3 to the direction of the flutes or in a direction close to the latter as provable by shrinkage tests.
- 1 118.(currently amended) The laminate according to claim 112, wherein the ply A is composed
- 2 of several films, and the said main direction of molecular orientation, is the resultant of different
- 3 monoaxial or biaxial orientations in the said films optionally mutually differently directed.
- 1 119.(currently amended) The laminate according to claim 117, wherein the ply B is composed
- 2 of several films, and the said main direction of orientation is the resultant of different monoaxial or
- 3 biaxial orientations in the said films optionally mutually differently directed.
- 1 120.(currently amended) The laminate according to claim 100101, wherein the first attenuated
- 2 zones are present in at least one of the two plies wherein and if such the first attenuated zones of
- 3 attenuated ply extend in their transverse direction beyond the corresponding bonding zones of
- 4 bonding into adjacent non-bonding non-bonded zones of the ply, the extensions within each
- 5 non-bonded non-bonding zone are limited to a total width which leaves more than half of and

- 6 preferably no less than 70% of the a width of the non-bonded non-bonding zone as not belonging
- 7 to any first attenuated zone, these widths being the distances measured along the curved surfaces.
- 1 121.(currently amended) The laminate according to claim 100101, wherein the first attenuated
- 2 zones are present in at least one of the plies and in which the bonding zones are generally
- 3 substantially coincident with the first attenuated zones.
- 1 122.(currently amended) The laminate according to claim 100101, wherein the first attenuated
- 2 zones are present at least in one of the two plies and characterized characterized by a second
- 3 solid-state-attenuated zones between each pair of adjacent first attenuated zones, said the second
- 4 attenuated zones being narrower than said the first attenuated zones and located on the non-bonded
- 5 crests of the respectively ply.
- 1 123.(currently amended) The laminate according to claim $\frac{100}{101}$, wherein at least one of the
- 2 two plies exhibits solid-state-attenuated zones wherein the first attenuated zones of the ply are
- 3 attenuated so that the minimum thickness in such zone is less than 75% of the maximum thickness
- 4 of the ply in the non-bonded zones, preferably less than 50% and more preferably less than 30% of
- 5 that maximum thickness.
- 1 124.(currently amended) The laminate according to claim 100, wherein the ply A and the ply
- 2 B consist of comprise a material which is orientable at room temperature; preferably they mainly
- 3 consist of polyolefin.
- 1 125.(currently amended) The laminate according to claim 100, wherein the spot-bonding spot
- 2 <u>bonds</u> between the plies A and B is effected through a lower melting surface layer on at least one of
- 3 the plies, formed in a coextrusion process.
- 1 126.(previously presented) The laminate according to claim 100, wherein at least one of the plies
- 2 comprises a barrier film designed for protection against oxygen or other gaseous materials.

- 1 127.(currently amended) The laminate according to claim 100, wherein at least some of the
- 2 flutes in one or both plies are flattened at intervals and preferably bonded across each ones entire
- 3 width at the flattened locations to make the two arrays of flutes form closed pockets.
- 1 128.(previously presented) The laminate according to claim 127, wherein the flattened portions
- 2 of a number of mutually adjacent flutes or of all flutes are in an array.
- 1 129.(currently amended) The laminate according to any of claim 100, wherein by the choice of
- 2 polymer material or by an incorporated filler or by orientation, the a coefficient of elasticity E in at
- 3 least one of the plies, measured in the unbonded zone non-bonding zones of the ply in the direction
- 4 parallel to the flute, as an average over the unbonded zone non-bonding zones is no less than 700
- 5 MPa, and preferably no less than 1000 MPa.
- 1 130.(currently amended) The laminate according to claim 100, wherein at least some of the
- 2 channels formed by the flutes in the ply A and the ply B, which channels may be closed to pockets,
- 3 contain a filling material in particulate, fibrous, filament or liquid form.
- 1 131.(currently amended) The laminate according to claim 130, wherein said the material is a
- 2 preservative for goods intended to become packed in or protected by the laminate, preferably an
- 3 oxygen scavenger or ethylene scavenger, a biocide, such as a fungicide or bactericide, a corrosion
- 4 inhibitor or a fire extinguishing agent, optionally with micro-perforations established in the flutes
- 5 to enhance the effect of said preservative.
- 1 132.(currently amended) The laminate according to claim 100, wherein both the ply A and the
- 2 ply B are supplied with a multitude of perforations, whereby the perforations do not reach into the
- 3 bonded spots spot bonds, and the perforations in the ply A are displaced from the perforations in the
- 4 ply B so as to cause gas or liquid when passing through the laminate, to run a distance through the
- $5 \quad \text{flutes } \underline{\text{generally}} \ \underline{\text{substantially}} \ \text{parallel to the main surfaces of the laminate; } \\ \underline{\text{the}} \ \text{channels formed by} \\$
- 6 the flutes may be closed to form pockets.
- $1 \quad 133. \textbf{(previously presented)} \quad The \ laminate \ according \ to \ claim \ 132, wherein \ the \ channels \ or \ pockets$

- 2 contain filling material adapted to act as a filter material by holding back suspended particles from
- 3 a fluid passing through the channels or pockets or is an absorbent or ion-exchanger capable of
- 4 absorbing or ion-exchanging matter dissolved in such fluid, said the filler optionally being
- 5 fibre-formed or yarn-formed.
- 134.(currently amended) The laminate according to claim 133, wherein by choice of 1
- 2 hydrophobic properties of at least the inner surfaces of the channels or pockets formed by the flutes
- 3 and by selected small spacing of said channels or pockets, and choice of the distances between the
- mutually displaced perforations in the ply A and the ply B, there is achieved a desirable balance 4
- between the pressure needed to allow water through the laminate and the laminate's capability to 5
- 6 allow air and vapour to pass therethrough.
- 1 135.(currently amended) The laminate according to claim 132, wherein by a nap of further
- 2 comprising fibre-like film portions protruding from the borders of the perforations of at least on one
- 3 surface of the laminate.
- 136.(currently amended) The laminate according to claim 134, used as a sanitary backsheet,
- preferably on a diaper or as a sheet for covering a patient during surgery. 2
- 1 137.(previously presented) The laminate according to claim 134, used for insulation of buildings.
- 1 138.(previously presented) The laminate according to claim 132, used as a geotextile which allows
- 2 water to pass but holds fine particles back.
- A bag made from the laminate according to any of the claims 100 to 1 139.(currently amended)
- 2 139138, wherein the flutes on one of the two major surfaces of the bag are generally substantially
- 3 perpendicular to the flutes on the other major surface of the bag.
- 1 140.(withdrawn and currently amended) A method of manufacturing a laminate of a first monofilm-formed or multifilm-formed ply with a second monofilm-formed or multifilm-formed ply
- 3 both mainly consisting of orientable thermoplastic polymer material, in which the first ply hasa

2

4 waved flute configuration, and the second ply on a first side is adhesive bonded in bonding zones 5 to the crests on a first side of A, in which further the waved flute structure of the first ply is formed by the use of a grooved roller, and the said bonding with the second ply is carried out under heat and 6 7 pressure and also under use of a grooved roller, wherein 8 the second ply also is given a waved configuration, whereby under use of at least one 9 grooved roller the flute direction of the second ply is made at an angle to the flute direction of the first ply and the said bonding zones are established on the crests of 10 11 the first side of the second ply to introduce spot bonding spot bonds with the crests 12 on the first side of the first ply. the adhesive bonding 13 b) is directly first to second ply and established through a lamination layer on 14 D 15 at least one of these plies; established through a separate thin bonding film; or 16 ii) 17 iii) established through a fibrous web adapted to the bonding; and 18 the wavelengths of the flutes in both plies are no longer than 10 mm, and the c) 19 wavelengths of the flutes in at least one of the plies are no longer than 5 mm. 141.(canceled) 142.(canceled) 143.(canceled) 144.(canceled) 145.(canceled) 146.(canceled) 147.(canceled) 148.(canceled) 149.(canceled) 150.(canceled) 151.(canceled) 152.(canceled)

- 1 199.(new) The laminate according to claim 102, wherein the flute wavelength in each of the two
- 2 plies is no more than 3 mm.
- $1\quad 200. (\textbf{new}) \qquad \text{The laminate according to claim } 102, \text{wherein the flute wavelength in each of the two}$
- 2 plies is no more than 2 mm.
- 1 201.(new) The laminate according to claim 103, wherein each of the two plies the curved length
- 2 of a flute is on average at least 10% longer than the linear wavelength.
- 1 202.(new) The laminate according to claim 105, wherein the width of each bonding zone in at
- 2 least one of the two plies is no less than 20% of the flute wavelength.
- 1 203.(new) The laminate according to claim 105, wherein the width of each bonding zone in at
- 2 least one of the two plies is no less than 30% of the flute wavelength.
- $1\quad 204. \textbf{(new)} \qquad \text{The laminate according to claim 114, wherein the yield tension in the ply A in a}$
- $2\quad direction\ parallel\ to\ its\ flute\ direction\ and/or\ the\ yield\ tension\ in\ the\ ply\ B\ in\ a\ direction\ parallel\ to$
- 3 its flute direction, both referring to the cross-section of the respective ply and determined in
- 4 non-bonded narrow strips at an extension velocity of 500%min⁻¹, is no less than 50 MPa and still
- 5 more preferably no less than 75 MPa.
- 1 205.(new) The laminate according to claim 114, wherein the yield tension in the ply A in a
- 2 direction parallel to its flute direction and/or the yield tension in the ply B in a direction parallel to
- 3 its flute direction, both referring to the cross-section of the respective ply and determined in

- 4 non-bonded narrow strips at an extension velocity of 500%min⁻¹, is no less than 75 MPa.
- 1 206.(new) The laminate according to claim 116, wherein the ply B comprises a thermoplastic
- 2 elastomer.
- 1 207.(new) The laminate according to claim 120, wherein the total width of the extensions leaves
- 2 no less than 70% of the width of the non-bonding zone as not belonging to any first attenuated zone.
- 1 208.(new) The laminate according to claim 122, wherein the first attenuated zones of the ply are
- 2 attenuated so that the minimum thickness in such zone is less than 50% of that maximum thickness.
- 1 209.(new) The laminate according to claim 122, wherein the first attenuated zones of the ply are
- 2 attenuated so that the minimum thickness in such zone is less than 30% of that maximum thickness.
- 1 210.(new) The laminate according to claim 123, wherein the ply A and the ply B comprise a
- 2 polyolefin.
- 1 211.(new) The laminate according of claim 129, wherein the the average over the non-bonding
- 2 zone is no less than 1000 MPa.
- 1 212.(new) The laminate according to claim 131, wherein the preservative is selected from the
- 2 group consisting of an oxygen scavenger, ethylene scavenger, and a biocide.
- 1 213.(new) The laminate according to claim 131, wherein the laminate further includes
- 2 micro-perforations established in the flutes, which enhance the effect of the preservative.
